Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____
Inventors (please provide full names): _____
_____ *please see the attachment*

Earliest Priority Filing Date: _____

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

I please search for compounds SD(1-17) on pages 17-20

II please search for compounds SSD(1-19) on pages 43-46

III please search for a green sensitive silver halide emulsion layer in a photographic material containing both compounds in "I" and "II" above, especially with 50/50 wt % of a mixture of compound SD-2 and SSD-9 as elected in Table 1-1. Sample "101 (Inv)" on page 47.

Thank you.

The green sensitive silver halide emulsion may be sensitized by sensitizing dyes using any method known in the art. Dyes may be added to the silver halide emulsion singly or together. A preferred method of addition of the dyes to the silver halide is by premixing them as a solution in a suitable solvent, as a mixed dispersion in aqueous gelatin, or as a mixed liquid crystalline dispersion in water. Of course, green sensitized silver halide emulsions will be sensitized in accord with the requirements as described. The dye or dyes may be added to the silver halide emulsion grains and hydrophilic colloid at any time prior to or simultaneous with the application of a liquid coating solution comprised of the

EXAMPLE I

COMPONENT PROPERTIES

Photographic samples 101 through 158 were prepared. For all samples, emulsion A, with an iodide content of 3.8 mole percent, based on silver, was used. The mean equivalent circular diameter of the emulsion was 2.5 μm , the average thickness of the tabular grains was 0.12 μm , and the average aspect ratio of the tabular grains was 20.8. Tabular grains accounted for greater than 90% of the total grain projected area.

Emulsion A was sensitized using sodium thiocyanate at 120 mg/mole of silver, 0.90 mmole of spectral sensitizing dye per mole of silver, sodium aurous(I) dithiosulfate dihydrate at 2.2 mg/mole of silver, sodium thiosulfate pentahydrate at 1.1 mg/mole of silver, and 3-(N-methylsulfonyl)carbonyl-ethylbenzothiazolium tetrafluoroborate at 45 mg/mole of silver. Following the chemical additions the emulsion was subjected to a heat treatment at 62.5 $^{\circ}\text{C}$ for 20 minutes as is common in the art.

Sensitizing dyes used for the spectral sensitization are given in Table 1-1. The multiple dye sensitizations were accomplished by either adding the dyes simultaneously, adding dyes as two separate additions of two dye mixtures (sets of dyes added together are given in parentheses), or by adding each dye

AB Color reversal photog. material is described that has superior skin color reproduction and has improved adaptability for various light sources and color temperature dependency of light sources.

Thus,

the color reversal photog. material comprises ≥ 1 interimage effect imparting layer (a) and ≥ 1 interimage effect imparting layer (b) in addition to the blue-, green- and red sensitive emulsion layers. When the photog. material is exposed to light of a "skin color" and is then developed a ratio of the chroma C^*70 at a brightness $L^* = 70$ represented by CIE Lab color system to the chroma C^*50 at a brightness $L^* = 50$, C^*70 / C^*50 , is 0.7 or more. The interimage effect imparting layers have spectral distribution different than that of a main blue-, green- and red sensitive emulsion layers. Thus, the interimage effect layer a contains a short-wavelength **green-sensitive** silver halide emulsion having a weight-averaged wavelength of a spectral sensitivity distribution of 500-560 nm and the interimage effect imparting layer b contains a red-sensitive silver halide emulsion having a weight-averaged wavelength of a spectral sensitivity distribution of 580-700 nm.

AB An imaging element comprises a transparent polymer sheet, and at least one photosensitive dye forming coupler containing layer is on each side of said sheet and wherein there are at least four sep. photosensitive layers and the photosensitive layers comprise at least four dye forming couplers that form at least four spectrally distinct colors. Dye forming couplers include cyan, yellow,

magenta, red and blue. The invention provides an imaging material with an improved color gamut while maintaining typical the 45 s color development time.

AB In the photog. material comprising a support coated with ≥ 1 red-sensitive, ≥ 1 **green-sensitive**, ≥ 1 blue-sensitive ≥ 1 nonphotosensitive layers, and ≥ 1 interlayer effect layer, the interlayer effect layer has maximum spectral sensitivity wavelength at ≤ 500 or ≥ 560 nm (which is different from the maximum wavelength of the red-sensitive, **green-sensitive**, and blue-sensitive layers) and contains a compound satisfying the following; the compound comprises a coupling component (Cp), a photog. useful component (A), and a timing group (Time), and cleaves between Cp and Time by the coupling reaction with the developer oxide and then cleaves between A and Time by electron-transfer reaction or intramol. nucleophilic reaction to release the photog. useful component. The material may comprise a support having ≥ 1 nonphotosensitive layer and ≥ 1 non-visible ray-sensitive layer having maximum spectral sensitivity wavelength at ≥ 700 nm and containing Ag halide emulsion spectrally sensitized with ≥ 2 dyes having different charges. The material shows high sensitivity, storage stability, and gives low fog images with good color reproducibility.

AB The invention relates to a color neg. photog. element comprising a support, upon which is coated a blue sensitive silver halide layer containing a yellow dye forming coupler, a **green sensitive** silver halide layer containing a magenta dye forming coupler, a red sensitive silver halide layer containing a cyan dye forming coupler, and a 4th sensitized layer containing an IR dye

forming coupler and wherein the dye formed by the IR dye forming coupler has a λ -max greater than 680 nm and wherein the d. of the absorption band of the characteristic vector of the cyan dye, normalized to 1.0 d., is less than 0.4 at 700 nm.

AB In the title material possessing ≥ 1 blue-sensitive,
 ≥ 1 **green-sensitive**, and ≥ 1
red-sensitive Ag halide emulsion layers containing yellow, magenta,
and cyan couplers, resp., and ≥ 1 non-photosensitive layer
on a support and satisfying the relations $500 \text{ nm} < \lambda\text{-R} <$

560 nm and $\lambda_G - \lambda_R \geq 10$ nm [λ_R = central wavelength in the spectral sensitivity distribution of the interlayer effect which all the red-sensitive layers undergo from the other emulsion layers in the range of 500-600 nm; λ_G = central wavelength in the spectral sensitivity distribution of ≥ 1 of the **green-sensitive** layers], the content of Ca in ≥ 1 of the constitutive layers is 4.0 + 10⁻³-8.0 + 10⁻² g/g gelatin in the layer. The material shows improved color reproducibility, storage stability, and latent image stability.

AB The films contain (i) reduction-sensitized granular Ag halides and
 (ii) I (A = bivalent linkage containing ≥ 1 element other than
 C; Z = 5- or 6-membered heterocycle; L_{1,2} = methine; p = 0, 1; M =

counter ion; m = 0-10 necessary to keep the electronic neutrality; Q = atomic groups forming methine dye). The films may include R101SO2SM101, R101SO2SR102, and/or R101SO2SEaSSO2R102 (R101-103 = aliphatic or aromatic groups, heterocycle; M101 = cations; E = bivalent linkages; a = 0, 1). The films may include transparent magnetic recording layers. The films provide low-fog photographs with high throughput. Thus, a Ag(Br, I) emulsion chemical sensitized by HAuCl₄ and Na₂S₂O₃, then by N,N-dimethylselenourea and KSCN, and spectrally sensitized by 3-(1-sulfo-2-hydroxypropyl)-3'-sulfopropoxyethyl-5,5'-di-bromo-9-ethyl-benzo-oxacarbocyanine (Na salt) was used for the **green-sensitive** layer of a multilayer color neg. film.

GI

AB Claimed photog. material is characterized by that ≥ 1 emulsion layer is spectrally sensitized by the combination of oxacarbocyanine I, monomethyne-cyanine II and a imidacarbocyanine III, where R1-7 = alkyl, alkenyl; R4 = H, alkyl, aryl; R8, R9 = alkyl, alkenyl, aryl; Z1, Z2, Z5, Z6 = benzo; Z3, Z4 = a ring structure selected from picoline, pyridine, quinoline, indolenine, benzoazole, azole, etc, X1-3, n1-3 = counter ions and their number for electronic neutrality. It has high photog. speed and good latent image stability, consequently, it is suitable for camera-use films, such as multilayer color neg. films. Thus, the lowest speed layer among **green-sensitive** layer unit of a multilayer color neg. film spectrally was sensitized by 1,1'-di-methyl-3,3'-di-sulfopropyl-5,5'-di-cyano-benzoimidacarbocyanine, 3-ethyl-3'-sulfopropyl-5,5'-di-chloro-9-ethyl-benzooxacarbocyanine and 3-triethylaminosulfoethyl-3'-sulfopropyl-naphthothiacyanine. The film product had the mentioned advantages.

AB A silver halide color photog. material having improved color reproducibility and high color sensitivity comprises a **green-sensitive** silver halide emulsion layer color-sensitized by ≥ 1 each of quinoline dyes, trimethyleneoxacarbocyanine dyes, and trimethyleneoxathiacarbocyanine dyes and the photog. material comprises a silver halide emulsion containing cubic or tetradecahedral silver halide grains with $\geq 70\%$ of them having the [100] plane.

AB In the title photog. material utilizing a **green-sensitive** Ag halide photog. emulsion layer together with a reducing agent and a color donor compound, The photog. emulsion layer is spectrally-sensitized with sensitizer dye (I) [R11, R12 = alkyl; Z11 = atoms required to complete benzene ring; Z12 = atoms required to complete benzothiazole or benzoselenazole ring; X11 = charge neutralizing ion; m = 0, 1; m = 0 when internal salt formation occurs]. Optionally, II [R21, R22, R23 = alkyl; Z11, Z22 = atoms required to complete benzoxazole, naphthoxazole, benzothiazole, naphthothiazole, benzimidazole, or naphthimidazole ring; X21 = charge neutralizing counter ion; n = 0,1] is used together with I. The spectral sensitivity of the short-wave side is increased.

AB A color silver halide photog. material possesses on a support at least each one of a yellow color coupler-containing **green-sensitive** silver halide emulsion layer, a cyan coupler-containing red-sensitive silver halide emulsion layer, and a silver emulsion layer giving interlayer effect to the latter red-sensitive layer which is spectrally sensitized by a sensitizing dye. The spectral sensitizing dye is represented by a cyanine dye (I; R11 - R14 = H, alkyl, aryl, aralkyl, alkoxy, aryloxy, halo, aryloxycarbonyl, alkoxycarbonyl, NH2, cyano, CONH2, CO2H, acyloxy; R11 and R12 or R13 and R14 do not simultaneously represent H; R15, R16 = alkyl, aralkyl; R17 = C_≥3 alkyl, aryl, aralkyl; X1 = counter anion; m = 0,1; when an inner is formed, m = 0). A plural number of silver halide emulsion layers giving interlayer effect are present in the photog. material, at least two of which possess silver halide grains with different average grain sizes wherein the silver halide emulsion layer with larger average grain size contains less development inhibitor-releasing compound per 1 mol silver halide than the silver halide emulsion layer with smaller average grain size. At least one of silver halide emulsion layers giving interlayer effect contains a development inhibitor-releasing compound [II; R = H, substituent; Z = a group of nonmetal atoms required to form an (un)substituted azole ring containing 2-4 N atoms; X = a group becoming a development inhibitor or its precursor after being cleaved by coupling reaction with an oxidized form of a developing agent and optionally reacting further with another mol. of the oxidized form of a developing agent]. This color photog. material uses spectral sensitizers which strongly absorb light at 500-560 nm in the silver halide emulsion layer giving interlayer effect to the red-sensitive layer and provides high chromaticness and excellent color reproduction and graininess.

AB The title multicolor filter is obtained by forming a **green**
-**sensitive** layer containing halide and a dye sensitive to
500-600-nm light, and a red-sensitive layer containing Ag halide and a
dye sensitive in the 400-500 and 600-700-nm wavelength region, a
blue-sensitive Ag halide containing layer, and a yellow filter sheet,
exposing to patterned red, green, blue, and black light, resp. and
coloring via external coloring to magenta, cyan, and yellow,
resp., and removing Ag from the exposed areas. The dyes used are
1,1'-diethyl-2,4'-cyanine iodide and 1,1'-diethyl-2,2'-cyanine
iodide for the **green-sensitive** layer, and
1,1'-diethyl-2,4'-carbocyanine iodide or 3,3'-
diethylthiodicarbocyanine iodide for the red-sensitive layer.

AB A Ag halide color photog. material is described comprising blue-, green-, and red-sensitive layers where the blue-sensitive layer has the maximum spectral sensitivity at a wavelength within the range of 415-470 nm and the spectral sensitivity at 480 nm of the blue-sensitive layer is $\leq 35\%$ of the maximum sensitivity. The **green-sensitive** layer has the maximum spectral sensitivity at a wavelength within the range of 530-560 nm and the spectral sensitivity at 500 nm of the **green-sensitive** layer is $\geq 25\%$ of the maximum sensitivity. The material is excellent in reproducibility of the green or blue subjects.

AB In the title full-color photog. material, the Ag halide grains contained in ≥ 1 **green-sensitive** emulsion layers are spectrally sensitized by ≥ 1 I, ≥ 1 II and ≥ 1 III [R1,2,4-7 = alkyl, alkenyl; R3,8 = H, alkyl, aryl; X1-3 = anions with counter charge; l, m, n = ≥ 1 to neutralize the mol. net charge; Z1,2 = atoms required to complete benzoxazole; Z3,4 = atoms required to complete pyrroline, pyridine, quinoline, indolenine, benzimidazole, oxazole, benzoxazole, naphthoxazole, thiazoline, thiazole, benzothiazole, naphthothiazole, (benzo)selenazole, naphthoselenazole; Z5,6 = atoms to form naphthothiazole]. This photog. material shows good color reproducibility and improved long-term stability.

AB In the title material comprising a support having thereon one or more blue-sensitive Ag halide emulsion layers, **green-**

sensitive Ag halide emulsion layers, and red-sensitive Ag halide emulsion layers, at least one of the **green-sensitive** Ag halide emulsion layers has a reflection spectrum, the wavelength of one of the maximum absorption peaks is 500 to 540 nm, and the wavelength of the other is 540 to 580 nm. The material contains sensitizing dyes and gives excellent color reproduction.

GI

AB In a Ag halide color photog. material having a red-sensitive Ag halide emulsion layer (A), a **green-sensitive** Ag halide emulsion layer (B), and a blue-sensitive Ag halide emulsion layer (C), the Ag halide emulsion of the emulsion layers A, B, and C is the AgBr emulsion having ≥ 95 mol% AgCl content and furthermore the A and/or B Ag halide emulsion is spectrally sensitized in the blue wavelength region to satisfy the following equations $1.8 \leq BS(C)-BS(A) \leq 2.4$ and $1.4 \leq BS(C)-BS(B) \leq 2.0$ [BS(C), BS(A), BS(B) = blue-sensitivity of the A, B, and C emulsion layer expressed as $\log (1/\text{exposure})$ where the cyan, magenta, and yellow optical d. = 1] in the grain formation and/or chemical sensitization step, while in the emulsion layers A and B ≥ 2 Ag halide emulsions are mixed to set the γ values of the emulsion layers A and B 0.6-1.3 times greater than that of the emulsion layer C. Preferably the photog. material contains a pyrazoloazole-series coupler [I; R = H, substituent; Y4 = H, leaving group; Z, Z1, Z2 = (un)substituted methine, N, NH; one of Z-Z1, Z1-Z2 bonds = double bond and the other = single bond; when the Z-Z1 bond = double bond, it is optionally a part of an aromatic ring; I optionally forming ≥ 2 polymer via R, Y4 or substituted methine in Z, Z1, or Z2]. This photog. material provides color reproduction of details in from low to high d. parts and subtle tone of the original color in the high d. region and sharp original color with little turbidity.

AB A Ag halide color photog. material is described having maximum spectral sensitivity (λ_B) of the blue-sensitive emulsion layer at 410-470 nm and sensitivity at 480 nm $\leq 1/2$ that at λ_B . Preferably, the maximum sensitivity wavelength (λ_G) of the **green-sensitive** layer is at 530-560 nm and its sensitivity at 500 nm is $\geq 1/4$ that at λ_G . The maximum sensitivity wavelength of the red-sensitive layer is at 595-625 nm and its maximum sensitivity at 400-480 nm is $\geq 1.5\%$ of the sensitivity of the blue-sensitive layer at λ_B . The material provides high chroma and excellent hue reproduction

AB Spectral sensitization was studied using oxacarbocyanine, benzimidazolocarbo-cyanine, benzimidazolooxacarbocyanine, thia-2'-cyanine, 2,2'-cyanine, and meso-position Me-substituted selenocarbo-cyanine dyes and their mixts. ESR and polarog. measurement of dyes and photog. emulsion tests showed that the efficiency of the supersensitizing mixts. is related to the ESR signal and the polarog. half-wave potential. When the highest occupied energy level of the sensitizer was just above the top of the valence band of Ag(Br,I), no ESR signal was detected. The signal usually occurred when the oxidation electron potential of the supersensitizer was <0.88 V, i.e., lower than the oxidation electron potential of the sensitizer. The function of supersensitization can be explained by its hole-trapping mechanism.

 LANGUAGE: English

AB The ESR spectra of some **green sensitizing** dyes
 and supersensitizing dye combinations adsorbed on the surface of
 Ag(Br,I) emulsion grains were investigated at both room temperature
 (297 K) and low (130 or 110 K) temperature Some **green sensitizing**
 dyes thought to trap photo holes gave no ESR
 signal at 297 K, but did give ESR signals at 110 or 130 K. The
 ESR signals originate from the presence of dye pos. holes. At low
 temps., e.g., 110 or 130 K, the measurement was more sensitive.
 The dye pos. holes have different temperature-dependent stabilities.
 At a given temperature only those dye pos. holes with lifetime longer
 than the response time of the ESR spectrometer will be detected.
 Therefore, the ESR measurements at low temps. are useful in

studying the mechanisms of spectral sensitization and supersensitization.

PRIORITY APPLN. INFO.:

AB A black-and-white photog. material for photog. masks consists of a transparent support and ≥ 1 blue-sensitive emulsion layer, ≥ 1 **green-sensitive** emulsion layer, and ≥ 1 blue-sensitive emulsion layer, the blue-sensitive emulsion layers containing a neg.-type photosensitive Ag halide emulsion layer and the **green-sensitive** and red-sensitive Ag halide emulsion layers containing autopol.-type photosensitive Ag halide emulsion layers. The above material may use ≥ 1 blue-sensitive emulsion layer and ≥ 1 yellow-sensitive emulsion layer, the blue-sensitive layers containing a neg.-type photosensitive Ag halide emulsion layer and the yellow-sensitive layers containing an autopol.-type photosensitive Ag halide emulsion layer. The material is useful in image conversion employing the blue-screen method and is useful in cinematog. industry.

AB A method is described for processing a color photog. material having a light-sensitive Ag halide emulsion layer containing a sensitizing dye of the formula I [Z1, Z2 = group necessary for formation of an azole, pyridine, or quinoline nucleus; R1, R2 = alkyl, alkenyl, aryl; R3 = H, Me, Et; X = anion; l = 1 or 0]. The dry thickness of the above layer and a nonlight-sensitive Ag halide layer is $\geq 10 \mu\text{m}$. The material is exposed, developed in a solution containing no benzyl alc., fixed, and stabilized in a solution having surface tension 8-50 dynes/cm and containing no aldehyde compound and containing ≥ 1 of AO(B)mX1 and R4R5R6R7N+X2- [A = C6-20 alkyl or arylalkyl; B = ethylene oxide or propylene oxide; m = 4-50; X1 = H, SO3Y , or PO3Y2 ; Y = H, alkali metal, NH4 ; R4-R7 = H, alkyl, Ph; total C atoms of R4-R7 is 3-50; X2 = anion]. The process is followed by drying. A photog. paper was prepared by incorporating II as the sensitizing dye in the **green-sensitive** layer, III in the red-sensitive layer, and IV in the blue-sensitive layer. The material was exposed and processed in a developer containing no benzyl alc. and a stabilizing solution having a surface tension of 36 dynes/cm and containing

C₈H₁₇-p-C₆H₄O(C₂H₄O)₁₀H. The white background appeared more white than in the H₂O-washing method and the spectral reflective d. and fading of the yellow dye were 0.098 and 22%, resp., compared to 0.132 and 34%, resp., for a process in which benzyl alc. was included in the developer and the surface tension of the stabilizer solution was 70 dynes/cm.

AB HMO theory was used to calculate the electronic energy level of a
series of sym. and unsym. oxacarbocyanine,
benzimidazolooxacarbocyanine, and quinoline-thiocyanine dyes, and
their polarog. half-wave potentials and spectral sensitization of
Ag halide emulsions were measured. There was a good agreement
between the calculated and measured values.

AB The light absorption and adsorption properties were studied of three cyanine dyes I, II, III were studied in solution and in their adsorbed states. Adsorption isotherms of dyes on suspended AgBr at 25° and the absorption (reflection) spectra of dyes in solns. and in adsorbed states were obtained. Very small heat affects (<10 mcal) accompanying dye adsorption were measured with the Versatile Model BD-1 Precision Semiconductor Calorimetric System using a specially designed calorimetric unit. The isosteric molar enthalpy of I adsorption on AgBr in H₂O was -(33.5 ± 2.5) kJ/mol (surface coverage θ = 94%). Dye combination study, spectra, isotherms as well as heat of adsorption, indicate further adsorption of dye I on AgBr dyed with II and/or III, forming possibly multilayers over the first layer of II and/or III, while no (or very little) adsorption of II and/or III can take place over dye I. This clarifies the fact that in the photog. emulsion production, the **green sensitive** dyes II and III must be added prior to the

AB The title materials consist of a support and ≥ 1 Ag halide emulsion layer containing ≥ 1 sensitizing dye I and/or II (X = O, S, Se; A = atomic grouping to form oxazole or oxazoline ring; X- = anion; R1 = H, alkyl, aryl; R2, R3 = alkyl; R4-7 = H, alkyl, halo, alkoxy, aryl, carboxyl, alkoxycarbonyl, aryloxycarbonyl, nitro, hydroxy, cyano, amino, acylamino, sulfonylamino, acyloxy, carbamoyl, sulfamoyl, sulfonyl, acyl, heterocycle moiety; R4R5, R5R6, and/or R6R7 may be combined to form a ring; m = 1, 2; when I forms an inner salt, m = 1; X1, X2 = S, Se; B, D = atomic grouping to form thiazole, benzothiazole, naphthothiazole, selenazole, benzoselenazole, or naphthoselenazole ring; R8 = H, alkyl, aryl; R9, R10 = alkyl; n = 1, 2; when II forms an inner salt, n = 1). The materials show high spectral sensitivity and do not cause photog. fog. Thus, 3.9 g III, 4.5 g IV, 80 mL MeOH, and 3 g Et3N were mixed and stirred at room temperature for 30 min and at 100° for 1 h to obtain V with λ_{\max} (MeOH) 522 nm. Then, 1 kg AgBr/AgI emulsion, 20 + 10⁻⁵ mol V, and 20 + 10⁻⁵ mol VI were mixed in MeOH and stirred, then mixed with 20 mL 10% aqueous 4-hydroxy-6-methyl-1,3,3a,7-tetraazaindene, 10 mL 1% aqueous 1-hydroxy-3,5-dichlorotriazine Na salt, and 10 mL 1% aqueous Na dodecylbenzenesulfonate and coated on a cellulose triacetate film support to form a 5- μ -thick photosensitive layer. The material upon wedge exposure using a yellow filter showed a good sensitivity of 235 vs. 131 without VI and 140 without V.

AB A color photothermog. process is claimed in which a photothermog. sheet having ≥ 3 Ag halide emulsion layers having different spectral sensitivities and containing yellow, cyan, and magenta dye-releasing compds. (reducing agent type) in appropriate emulsion layers or nonsensitive layers adjacent to the emulsion layers is imagewise exposed and heated simultaneously or sequentially in the absence of water to form hydrophilic diffusible dye images. Thus, a film support was coated with a red-sensitive emulsion containing sensitizer dye I, cyan dye-releasing compound II, guanidine trichloroacetate, dimethylsulfamide, and a surfactant, coated with an interlayer, coated with a **green** -**sensitive** emulsion containing dye III, magenta dye-releasing compound IV and other additives (same as the red sensitive layer), and after the formation of a 2nd interlayer, a blue-sensitive emulsion layer containing yellow dye-releasing compound V and other additives and a protective layer were formed to give a color photothermog. film. The film was imagewise exposed through

a color separation filter, heated at 130°, and contacted with a wetted receptor having a dye-mordanting layer at 80° to give clear 3-color images on the receptor.

AB A photog. emulsion with enhanced spectral sensitivity in **green-sensitive** region contains a dye sensitizer I ($R-R3 = H$, halo, alkyl, cycloalkyl, alkenyl, acyl, acyloxy, alkoxy, carbamoyl, sulfamoyl, CN, OH, CF_3 ; $R4 - R7 =$ alkyl, cycloalkyl, alkenyl; $X =$ anion; $n = 1, 2$) in combination with a compound II ($R8, R9 = H$, halo, alkyl, alkoxy, acyloxy, alkoxy, amino, acylamido, carbamoyl; $Z =$ alkylene, arylene, aralkylene, CO_2- , CO_2Z1 , OCO where $Z1 =$ alkylene, arylene, aralkylene; $X =$ anion; $m =$ integer of 1-19). Thus, 1 kg of a $Ag(Br, I)$ (I 7.5 mol %) emulsion with a mean grain diameter of $0.85 \mu m$ and containing 0.62 mol. Ag halide was heated at 40° and mixed with MeOH solns. of III $20 + 10^{-5}$ and IV $80 + 10^{-5}$ mol. The emulsion was stirred, mixed with 1 weight% aqueous 4-hydroxy-6-methyl-1,3,3a,7-tetraazaindene 15, 1 weight% aqueous 1-hydroxy-3,5-dichlorotriazine Na salt 20, and 1 weight% aqueous Na dodecylbenzenesulfonate 10 mL, and coated on a cellulose triacetate support to give a dry layer of 5μ . The element was

imagewise exposed and processed to give an image with a sensitivity of 191 and a fog of 0.03 vs. 100 and 0.04, resp., for a IV-free control.

AB A variable contrast photog. material is described which possesses high sensitivity for scanner exposure and shows a sufficiently steep gradation in the blue spectral region for use as a scan film along with a 50-100% flatter gradation in the green spectral region in comparison to the blue exposure. The material consists of a support with 2 emulsion layers, one of which is sensitive to blue and green light and the other which is sensitive to blue light. The exposure factor of the gradation curve for the blue sensitive layer lies in the region of its **green sensitivity** upon exposure of the material with light from 500 to 620 nm at a d. of 1.0-2.0 of the gradation for the **green sensitivity**. The material is especially useful in the production of color sepns. by exposure with a scanner and exposure in a copy apparatus for a γ - λ -variable material.

AB Multilayer color photog. papers possess reflectivity (of the unexposed area after photog. processing) at 570-660 nm, 480-570 nm, and 420-480 nm wavelength ranges of $\geq 70\%$, within $\pm 5\%$ of the reflectivity in the 570-660 nm range, and within $+10\%$ of the reflectivity in the 570-660 nm range, resp. The color photog. papers exhibit excellent image clearness. The above requirements

can be achieved easily by selecting proper support and photog. coating compns. especially by properly selecting blue-sensitizing dye and magenta coupler. Thus, a paper support was coated with (1) a polyethylene composition containing a white pigment (anatase and rutile

type TiO₂ mixture coated with Al₂O₃) and a bluing agent; (2) a blue-sensitive emulsion containing α -(1-benzyl-2-phenyl-3,5-dioxo-1,2,4-triazolidinyl-4)- α -pivalyl-2-chloro-5-[γ -(2,4-di-tert-amylphenoxy)butyramido]acetanilide (a yellow coupler) and the sensitizing dye I; (3) an intermediate layer; (4) a **green-sensitive** emulsion layer containing the magenta coupler II and the sensitizing dye III; (5) a UV-absorber containing intermediate layer; (6) a red-sensitive layer containing 2,4-dichloro-3-methyl-6-[α -(2,4-di-tert-amylphenoxy)butyramido]phenol (a cyan coupler), the sensitizer dye IV, and a fluorescent brightener; and (7) a gelatin protective layer. The photog. paper was developed without exposure to give average reflectivities of 83, 77, and 76% for 420-480, 480-570, and 570-660 nm wavelength regions, resp. The photog. paper was then sensitometrically exposed and developed to give relative sensitivity, γ -value, and yellow stain of 260, 3.00, and 0.05, resp.

PRIORITY APPLN. INFO.:

GI For diagram(s), see printed CA Issue.

AB Ag halide photog. materials are spectrally sensitized to the green region by using ≥ 1 carbocyanine dye I (R = lower alkyl; Z, Z1 = alkylene; R1, R2 = H, halo, lower alkyl, lower alkoxy; M = H, alkali metal, quaternary ammonium) and ≥ 1 carbocyanine dye II (R3, R4 = lower alkyl, substituted alkyl; R5, R6 = lower alkyl, hydroxyalkyl, sulfoalkyl; R7 = C ≥ 4 alkyl, aryl, substituted aryl, R8, R9 = H, halogen atom, sulfamoyl, alkylamido, alkoxy carbonyl, CN, CF₃; X- anion, n = 0.1). Optionally ≥ 1 compound of a general structure III (R10 = H, lower alkyl, alkoxy; R11 = H, halogen atom, lower alkyl, alkoxy; Z2 = S, Se; R12, R13 = lower alkyl, hydroxyalkyl, carboxyalkyl, sulfoalkyl; X- = anion; m = 0, 1) may also be used in combination with I and II. The photog. materials exhibit excellent **green sensitivity**. Thus, a AgBr0.97I0.03 photog. material containing IV 50 and V 30 mg/mol Ag halide had relative sensitivity, fog, and maximum sensitivity wavelength of 160, 0.03, and 575 nm, resp., vs. 160, 0.04, and 550 nm, resp., for a control with IV 100 mg/mol Ag halide and without V.

GI

AB The **green-sensitivity** of direct-pos. emulsions is increased by using a supersensitizing combination of ≥ 1 cyanine dye I (R = Cl, 4-morpholinosulfonyl; R1 = Me, (CH₂)₃SO₃H; R2 = (CH₂)₃SO₃⁻, CH₂CO₂⁻) and ≥ 1 cyanine dye II (R = (CH₂)₂CO₂H, (CH₂)₃SO₃⁻, (CH₂)₄SO₃⁻; R1 = H, Me, Ph; R2 = Et, (CH₂)₄SO₃Na; m = 1, 2) or III (R, R1 = Me, Ph, Cl; R2 = (CH₂)₃SO₃H,

(CH₂)₃SO₃Na, (CH₂)₄SO₃Na; R₃ = (CH₂)₃SO₃⁻, (CH₂)₄SO₃⁻). Thus, a gelatin-Ag(Br,Cl,I) emulsion containing I (R = Cl; R₁ = Me; R₂ = CH₂CO-) (IV) at 1 + 10⁻⁴ mol/mol Ag halide and II (R = (CH₂)₃SO₃⁻; R₁ = Ph; R₂ = (CH₂)₄SO₃Na; m = 1) (V) at 2 + 10⁻⁴ mol/mol Ag halide was coated on a support, dried, sensitometrically exposed, and developed to give a relative reversal sensitivity, a D_{max}, and D_{min} of 182, 2.4 and 0.07, resp., vs. 100, 2.3, and 0.09, resp., for a control containing IV alone and 79, 2.3, and 0.08, resp., for a control containing V alone.

AB Supersensitizing combinations composed of a cyanine dye containing a benzisoxazole ring I ($R = (CH_2)_3SO_3Na$, $(CH_2)_4SO_3Na$, $(CH_2)_3SO_3H.C_5H_5N$; $R_1 = Et, Pr, Ph, CH_2CH:CH_2$; $X = O, NMe, NEt, N(CH_2)_2OH, N(CH_2)_2O(CH_2)_2OH$) and a cyanine or merocyanine dye not containing a benzisoxazole ring are described which give both improved red and **green sensitivity** in Ag halide materials. The Ag halide materials containing these dye combinations are especially useful for radiog., lithog., and microphotog. Thus,

to 1 kg of a gelatin-Ag(Cl,Br,I) (AgBr 16.5 mole%; AgI 0.3 mole%) emulsion were added 1% aqueous 4-hydroxy-6-methyl-1,3,3a,7-tetraazaindene 20, 1% aqueous Na 2-hydroxy-4,6-dichlorotriazine 10, 1% aqueous Na dodecylbenzenesulfonate 10 ml, a MeOH solution of 32 + 10^{-5} mole I ($R = (CH_2)_3SO_3H.C_5H_5N$; $R_1 = Et$; $X = NEt$) (II), and a MeOH solution of 8 + 10^{-5} mole III. This emulsion was then coated on a cellulose acetate support to give a dry thickness of 5μ , exposed using a step wedge and red, green, and blue filters, and developed to give a green filter sensitivity of 328, a red filter sensitivity of 175, and a fog of 0.05 vs. 264, 161, and 0.04, resp., for a III-free control and 264, 103, and 0.05, resp., for a II-free control.

AB A Ag halide photog. emulsion is spectrally sensitized by the use of a supersensitizing dye mixture of I (R1, R2 = H, Ph, halo, CO2H, alkoxy, carbonyl, alkyl, alkoxy, OH, CF3, CN; R3 = H, alkyl, R2 may combine with R1 or R3 to form a benzene nucleus; R4, R6, R7 = C1-6 alkyl or alkenyl, ≥ 1 of them is sulfoalkyl; R5 = H, alkylene when combining with R7; Z1 = atoms required to form a benzimidazole nucleus) with II (R8-11 = C1-6 alkyl, ≥ 1 of them is alkyl substituted with SO3- or CO2H; Z2, Z3 = atoms required to form a benzimidazole nucleus; X- = acid anion; n = 1-2) over the range of 500-570 nm while holding the maximum sensitizing wavelength over the range of 540-570 nm (within the green region). The photog. emulsion sensitized by the I-II mixture also produces less stain due to residual dyes remaining after development, than the conventionally supersensitized photog. emulsions. Thus, the sensitizing dyes III 10-3 and IV 5 + 10-4 mole were added to a Ag(Br,I) (I 4 mole %) emulsion 1 kg with agitation. The emulsion was allowed to stand at 40° for 15 min and, after the addition of a hardener and a coating aid, coated on a film support as a 7- μ layer to give a **green-sensitive** photog. material. The material was then exposed through a wedge to yellow light, and developed to show a relative **green sensitivity** of 120 vs. 16 and 100, resp. for controls using III and IV alone, resp.

AB A process is described for supersensitizing Ag halide emulsions in the green region by adding to the emulsion a combination of an oxacarbocyanine dye (I) with an imidazolocarbo-cyanine dye (II) at a total concentration $1 + 10^{-6} - 5 + 10^{-3}$ mole/mole Ag with a II/I molar ratio of 2-20. The dye combination may be added as an aqueous or an organic solution. The described supersensitization is useful

for preparation of a multilayer color Ag halide emulsion containing couplers. The dye combinations also have spectral compatibility with known **green-sensitizing** dyes for Ag halide emulsions.

AB Radiog. film-intensifying screen combinations leading to images of increased sharpness without impairing the sensitivity consisted of a radiog. film, emulsion-coated only on 1 side, and 2 intensifying screens, whereby the spectral sensitization maximum of the Ag halide emulsion coincides with the main fluorescence maximum of the intensifying screens in the spectral region >500 nm within ± 30 nm. The Ag halide emulsions contained **green-sensitizing** carbocyanines or rhodanines and the screens Tb-doped rare earth oxide sulfides. Thus, a radiog. film consisting of a polyester support coated with a Ag(Br,I) emulsion containing 36 mg **green-sensitizing** dye/kg and combined with 2 intensifying screens containing Tb-doped Gd oxysulfide was exposed to 80 kV and 2.5 mA and had sensitivity difference (with respect to a common combination consisting of a com. film

and 2 standard screens) +0.4, relative blur number 74, and fog 0.20
 vs. ±0, 100, and 0.21, resp., for the above common combination.

AB A combination of unsym. 2'-cyanine dyes and a benzimidazolocarbo-cyanine dye is used to improve the **green sensitivity** of photog. Ag halide emulsions. Thus, a photog. Ag(Br,I) emulsion film assembly was sensitized over the entire green region of the spectrum with a combination of 5,5',6,6' -tetrachloro-1,1' -diethyl-3,3' -bis(γ -sulfopropyl)benz-imidazolocarbo-cyanine betaine sodium salt, 3-carboxymethyl-1'-ethyl-5,6'-dimethoxythia-2'-cyanine betaine, and 3-carboxymethyl-1'-ethylthia-2'-cyanine betaine.

AB Photog. emulsions containing >30 mole % AgI can be spectrally sensitized efficiently with dyes having an oxidation potential of <1 V and a difference between the oxidation and reduction potentials of >2 V. Redox potentials of 27 suitable dyes are given. These dyes are especially useful in heat-developable systems, where they also give good contrast. In such systems most of the Ag is present as an organic salt, with an inorg. iodide added to form the light-sensitive AgI. Thus, 100 ml. of a solution containing 20.5 g Hg(NO₃)₂ (pH 2 with HNO₃) was added dropwise to 100 ml. of 11 g lauric acid in BuOAc at 10°. Then 50 ml. of 1 mole % [Ag(NH₃)₂]NO₃ was added. The Ag laurate was washed with H₂O and with Me₂CO, and then dispersed in 120 g of 15% poly(vinyl butyral) in iso-PrOH. To 20 g of this dispersion, the following were added: 1 ml. of 3.2% NH₄I in MeOH, 1 ml. of 0.1% of the betaine form of 5,5'-diphenyl-3,3'-disulfopropyl-9-ethyloxa-carbocyanine (I) (oxidation potential of 0.878 V and reduction potential of - 1.274 V) in MeOH, 1 ml. of 25% phthalazinone in Me Cellosolve, and 2 ml. of 70% p-phenylphenol in Me Cellosolve. This dispersion was coated on polyester support at a coverage of 1 g Ag/m². After drying at 50° for 30 min an overcoat of 15% (85:15) vinyl chloride-vinyl acetate polymer in THF was applied and dried. The system was exposed through a negative to 250,-000 lux from a W lamp and developed at 120° for 20 sec to give a good positive. A spectrogram showed the expected **green sensitivity**. A I-free control gave a blurred, indistinct, and mottled image.

AB The sensitivity of **green-sensitized**, Ag(I, Br) photog. emulsions can be increased by adding 0.05 to 0.3 mole % I- based on Ag before adding the spectral sensitizer. KI is the usual source of I-. **Green sensitizers** can be either oxacyanines such as anhydro-3,3'-bis(sulfopropyl)-5,5'-dichloro-9-ethyloxacarbocyanine, or sym. or unsym. imidocyanines, such as anhydro-3,3'-bis(sulfopropyl)-5,5',6,6'-tetrachloroimidocarbocyanine, or combinations of both types. Internal salts or dyes with I- or other counterions can be used. The addition of the I- can double the **green sensitivity**, with no change in the wavelength of the peak sensitivity.

AB A supersensitizing dye combination of an imidacarbocyanine with a thia- o selenapseudocyanine, each dye containing 1 or 2 carboxyalkyl or sulfoalkyl N-substituents, minimizes desensitization of the emulsion by diffusing azo- or anthraquinone dye developers. Thus, by combined use of I and II a relative emulsion speed of 230 could be obtained, compared with 76 and 34 for the individual dyes alone.

AB For sensitizing Ag halide emulsions to a high green (520-540nm) speed with min. residual stain at high-speed processing, suitable for x-radiog. with green-emitting intensifying screens, for cathode ray tube records, and for handling in red safelight, a combination of a thia or seleno-2'-cyanine with a J-band type imidoxacarbocyanine containing 1 or 2 sulfoalkyl groups is used. Thus, a 4:7 combination of I 4 + 10⁻⁵ mole and II 7 + 10⁻⁵ mole/kg in a Ag(Br, I) (93:7) emulsion produced a relative **green sensitivity** of 170, vs. 100 and 125 for the individual dyes sep.

GI For diagram(s), see printed CA Issue.
 AB For exposures <0.001 sec (flash lamp, cathode ray tube, laser) emulsions with Ag halide grains <0.8 μ in size are sensitized with a Au salt, a Pt metal salt, a sensitizing dye, and a supersensitizer having an Eredn. = -0.71- -1.7 V. The latter, which may be colorless, has an Epoxidn. higher than (Epoxidn. = -0.5 V) that of the main dye, which may be a cyanine or a

merocyanine dye. Thus, using dyes in solns. of $1 + 10^{-3}$ M concentration, the relative speed of a typical emulsion for exposure at 2

+ 10-6 sec when containing 32 ml of dye I (Eredn. = -1.036; Epoxidn. = -1.041 V) was increased from 100 to 480 by 16 ml of dye II (Eredn. = -1.47; Epoxidn. = -0.854 V).

 AB Division of Brit. 1,280,016. High spectral sensitization of Ag
 halide emulsions in the range 620-645 nm without a decrease in
 total sensitivity or formation of stain after development is
 obtained with a combination of carbocyanine sensitizing dyes (I;
 Z, Z1 = S, Se; R = Et, Pr, Bu, allyl; R1 = 3-sulfopropyl,
 3-sulfobutyl, 4-sulfobutyl, 4-carboxybutyl, or 5-carboxypentyl; X
 = anion; and n = 1 or in the case of an intramol. salt 0) and
green-sensitizing dye (II; Y1, Y2 = the atoms
 necessary to complete a 2-quinolyl, benzothiazole,
 benzoselenazole, or naphthothiazole nucleus; R3, R4 = allyl,

alkyl, carboxyalkyl, sulfoalkyl or aralkyl; X = an anion; and n = 1 or in the case of an intramol. salt 0, e.g. III, IV). Thus, a Ag(Br, I) gelatin emulsion (7 mole % AgI) containing 0.053, 0.015, and 0.015 mmole/kg emulsion, resp., of I (Z, Z1 = S, R = Et, R1 = (CH₂)₄SO₃⁻) (V), III, and IV had a sensitization maximum of 628 nm and a red sensitivity of 100 vs. 628 and 100 for a control emulsion containing only V.

GI For diagram(s), see printed CA Issue.

AB Emulsions are supersensitized by the addition of a combination of sensitizing dyes I and II, where R1, R2, and R3 are lower alkyl groups of which ≥ 1 is substituted by a sulfo group; R4 is H or forms an alkylene bond with R2; Z1 is a group completing a benzimidazole ring; A1, A2 are H, Ph, halogen, CO₂H, alkoxy, CO, alkyl, alkoxy, OH, CF₃, CN, or A2 condenses with A1 or A3 to form a benzene ring; A3 is H or alkyl, whereby ≥ 1 of A1, A2, or A3 is a benzene ring substituent if R2 and R3 are bridged into an alkylene group and Z1 is substituted by the same halogen atoms; R4, R6, R7, and R8 have the same significance as R1, R2 or R3 and in which ≥ 1 residue is an alkyl group substituted with sulfo or carboxyl groups, Z2 and Z3 are groups essential for formation of the benzimidazole rings, X- is an acid anion, and n = 1 or 2 and has the value 1 when an intramol. salt is formed. Thus, a Ag(Br, I) emulsion (4 mole I) containing 160 ml/kg 1 + 10⁻³ M I (A1 = Me, A2 = Cl, A3 = R4 = H, R1 = (CH₂)₃SO₃⁻, R2 =

CH₂CH₂OH, R₃ = Et, Z₁ = CH:CClCCl:CH) (III) and 40 ml/kg 5 + 10-4 M II (R₅ = (CH₂CH₂O)₂C₃H₈SO₃⁻, R₆ = R₈ = Et, R₇ = (CH₂CH₂O)₂C₃H₈SO₃H·N Et₃, Z₂ = Z₃ = CH:CClCCl:CH) (IV) had a relative **green sensitivity** of 225 and a fog level of 0.12, compared to 112 and 0.14 for an emulsion containing only 160 ml/kg III and 100 and 0.14 for an emulsion containing only 40 ml/kg of the IV solution

AB Combinations of I, where R1 is alkyl or sulfoalkyl, R2 is alkyl or alkoxy, R3 is H or alkyl, R5 is SO₃H or CO₂H, Y is S or Se, Z is an alkylene chain up to C₆, and X is an anion, with II, where R4 is an alkyl group and M is H⁺ or a cation, supersensitize Ag halide emulsions and at 0.01-0.3 g/1.5 g mole Ag halide increase **green sensitivity** while suppressing the red sensitivity imparted by II alone. Thus, anhydro[5-methyl(3-sulfopropyl)-2-benzoselenazole] (1-ethyl-6-methoxy-2-quinoline)methinecyanine hydroxide (III) and anhydrobis[5,6-dichloro-1-ethyl-3,4-sulfobutyl)-2-benzimidazole]trimethinecyanine hydroxide, Na salt (IV) were added to a high speed Ag(Br,I) emulsion each at 0.05 g/1.5 g mole Ag halide. The relative log speeds to green and red light (Ilford 404 and 204 filters) were 4.54 and 3.20 compared to 4.37 and 0 for 0.1 g III alone and 4.36 and 3.48 for 0.1 g IV alone.

AB Emulsions, useful for black-and-white and color films, are sensitized with a complex compound of I and II which increases markedly the sensitivity in the region 500-40 nm (R can be alkyl, alkenyl, etc.; R2 is alkyl; R3 is H or alkyl; R4 and R5 are sulfoalkyl, carboxyalkyl, etc.; R6 and R7 are alkyl, aryl, etc.; R8 is alkyl; Y is the nonmetal atoms closing a quinoline, pyridine, thiazole, or benzo- or naphthothiazole). The complex is obtained by boiling equimolar amts. of both components in a concentrated solution in 80% aqueous MeOH and separating the dye by dropwise addition of water. E.g., a Ag(Br, I) emulsion containing 1,1'-diethyl-2,2'-cyanine iodide (III), 2-(p-dimethylamino)styrylbenzothiazole, and a complex of III with anhydro-3,3'-bis(8-sulfobutyl)-5,5'-diphenyl-9-ethyloxa-carbocyanine hydroxide, had 2 sensitization maximum, at 545 and 575 nm, being sensitive in the spectral region at 500-40 nm which was not observed in an emulsion containing III only.

<p>AB The color reproduction of Ag halide emulsion film on exposure to day, W, or fluorescent light is improved by using blue-, green-, and red-sensitive emulsions that show practically theoretical sensitivity curves for wavelengths >450, 545 and 610 nm, resp., and whose sensitivity to wavelengths <450, 545, and 610 nm is decreased by application of suitable filter layers. Thus, cellulose acetate film was coated successively with (1) a red-sensitive emulsion containing Ag(I,Br), anhydro-5,6-dichloro-1-ethyl-3-(3-sulfobutyl)-3'-(3-sulfopropyl)-4',5'-benzobenzimidazolothiocarbocyanine hydroxide, anhydro-9-ethyl-3-methyl-5-phenyl-3'-(3-sulfobutyl)oxoselenocarbocyanine hydroxide, and anhydro-3,3'-bis(2-carboxyethyl)-5,5'-dichloro-9-ethylthiocarbocyanine chloride; (2) a layer of higher red sensitivity containing addnl. amts. of the same dyes; (3) a magenta filter layer containing bis[3-methyl-1-(p-sulfophenyl)-2-pyrazolin-5-one]trimethinoxonol; (4) a green-sensitized emulsion containing Ag(I, Br), anhydro-5,6-dichloro-1,3'-diethyl-3-(3-sulfopropyl)-benzimidazolooxacarbocyanine hydroxide, anhydro-5,5',6,6'-tetrachloro-1,1'-diethyl-3,3'-bis(2-</p>				

sulfonylethyl)benzimidazolocarbo-cyanine hydroxide, and 4-[(1-ethylnaphtho[1,2-d]thiazolin-2-ylidene)methylethylidene]-(3-methyl-1-(p-sulfophenyl)-2-pyrazolin-5-one); (5) a sensitized layer containing the layer (4) dyes; (6) a yellow filter containing 4-[(3-ethyl-2(3H)-benzoxazolylydene)-ethylidene]-3-methyl-1-(p-sulfophenyl)-2-pyrazolin-5-one monosulfonate; (7) a Ag(I, Br) emulsion containing a yellow color coupler (U.S. 2,875,057); (8) a blue-sensitized Ag(I, Br) emulsion containing the same yellow coupler; and (9) a yellow and uv filter containing 2-[(3-cyano-3-dodecylsulfonyl)-allylidene]-3-(3-sulfopropyl)thiazolidene K salt.

AB Photographic emulsions with improved **green**

sensitivity contain a carbocyanine dye. Thus, a solution of 2.5 g 2-(β -anilino vinyl)-1,3,3,5-tetramethyl-3H-indolium iodide and 2 g 5,6-dichloro-1-ethyl-2-methyl-3-(3-sulfopropyl)benzimidazolium hydroxide inner salt in 40 ml PhNO₂ and 3 ml Ac₂O₂ was refluxed 5 min in the presence of 2.5 ml Et₃N, and cooled to give a dye I, m. 226°, with λ_{\max} 508 nm (MeOH). To 100 g of Ag iodobromide emulsion, 4 ml I and 4 ml II in MeOH were added, the emulsion kept 10 min at 37°, coated on a glass plate, dried, exposed to light of 5400°K, the photosensitive layer exposed in the presence of yellow, red, or no filters, developed for 10 min at 20° in a composition containing anhydrous Na₂SO₃ 100, Metol 2, hydroquinone 5, borax 2, and H₂O to 1000 g, the developed layer treated with a fixing bath, and the sensitivity measured in the green (500-600 nm) region. Emulsions containing both I and II had improved sensitivity in the green region.

AB Photog. Ag halide emulsions sensitized with red sensitizers of the general formula I are supersensitized for red by the addnl. incorporation of **green sensitizers** of the general formula II. In formula I, X and Y are the same or different and are S, Se, CH:CH, or and alkyl(aryl)-amino group, R1 and R3 are the same or different and are alkyl, carbalkoxy, carbamoyl alkyl, or sulfo alkyl groups, R2 is H or a lower alkyl group, R5, R6, R9, R10 are the same or different and are H, halogen, alkyl, aryl, alkoxy, or CF3 groups, R4 and R8 are the same or different and are H or are together with R5 and R9; resp., part of a benzene ring, and R7 and R11 without or together with R6 and R10 have the same meaning; in formula II, R4, R5, R6, R7, R8, R9, R10, and R11 have the same meaning as in formula I, R13 and R14 are lower alkyl groups, R16 is H or an alkyl, aralkyl, or aryl group, A is O or a substituted amino group, and U and V are O and (or) S.
